

Leaves to be used as cuttings from rhizomatous begonias may be taken at any time, making sure that only healthy adult leaves are used.

Cuttings from tuberous begonias are taken at various stages of growth:

- a. basal cuttings (surplus shoots) are taken from the tuber early in the growing cycle,
- b. lateral shoots are taken when the plant is mature, and
- c. leaves may be taken as soon as suitable ones are mature.

*B. domingensis* propagated by stem tip cuttings
